

Post-Installation Setup

General Settings

Your first post-installation steps should head into *Settings / General*. **Time Zone**, **Date Format** and **Time Format** settings will be used to display date info for all post types.

Permalinks Settings

Now head to *Settings / Permalinks* and change **Common Settings** to **Post name**. You can also change URL slugs for all LSVR custom post types and their taxonomies below if needed.

Front Page / Blog Page

Head to *Settings / Reading*, set *Front page displays* option to *A static page* and choose which pages should be used as your **Front page** and **Posts page**. [More info](#).

Managing Menus

If you already have some pages / posts on your site (for example via importing demo content), you should check out *Appearance / Menus* to manage your site's menus.

Media Settings

Head to *Settings / Media* and change the settings to the following values:

- *Thumbnail size* – **300×300** (crop enabled)
- *Medium size* – **700×700**
- *Large size* – **1024×1024**

If you already have some images on your site, use a [3rd party plugin](#) to regenerate new image sizes based on the settings above.

Typography

If your site is running in a language other than English, you should check out *Appearance / Customize / Typography* and set the **Font Subsets** option accordingly. Please note that not all font families support all font subsets.

You may also notice that not all Google Fonts are available – we handpicked only the most popular ones. If you need to use font which is not available, disable Google Fonts (uncheck *Enable Google Fonts* option) and use some [3rd party plugin](#) instead.
